

S-S TRACKING LOCATOR

New

To search and locate drain pipes and blockages

Through the use of a high-quality tracking locator, it is always possible to locate the drain pipes or any blockages.

The tracking locator consists of two units, a transmitter and a receiver.

The transmitter is pushed into the drainage pipe with the flushing hose or a special polyester wire reel (option)

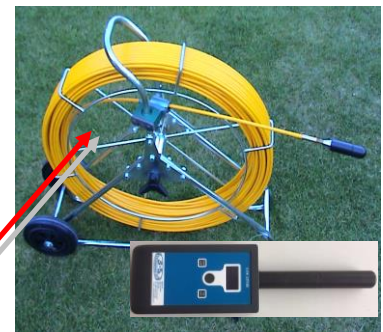

Using the hand-held receiver, which emits a signal tone, it's possible to follow the path of the transmitter while it is traveling up the drain pipe.

However, it is also possible to look for the transmitter on the field by using the course adjustment first on the receiver, the transmitter will be in range ± 3 to 4 meters.

The location of the transmitter can be further be determined using fine adjustments

on the receiver down to an area of 60 cm x 60 cm.

As a result, the location of the blocked drain is reduced to a minimum with less digging..
